

NetFlow Module

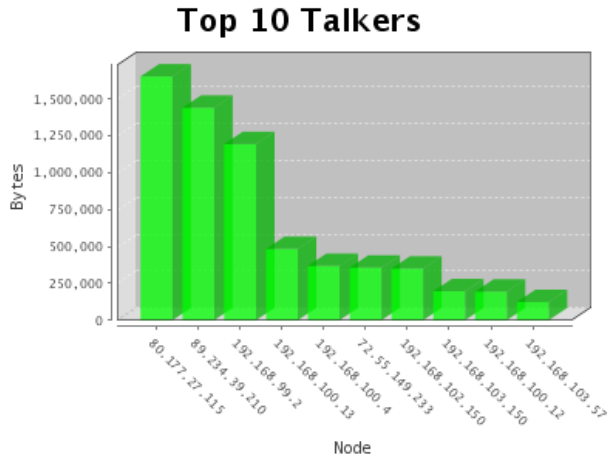

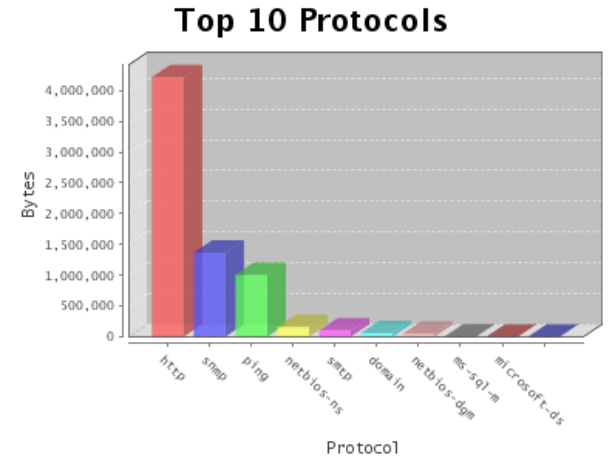

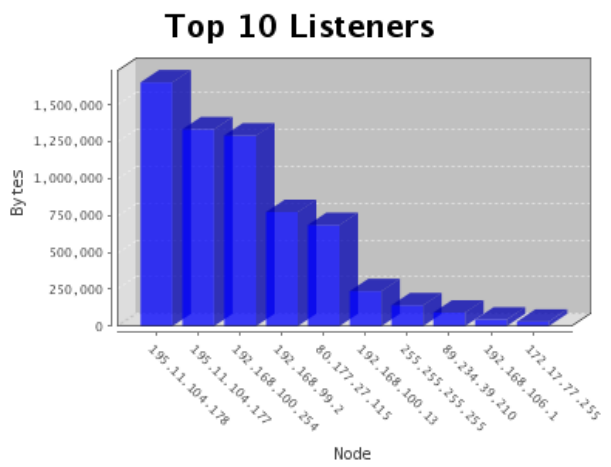

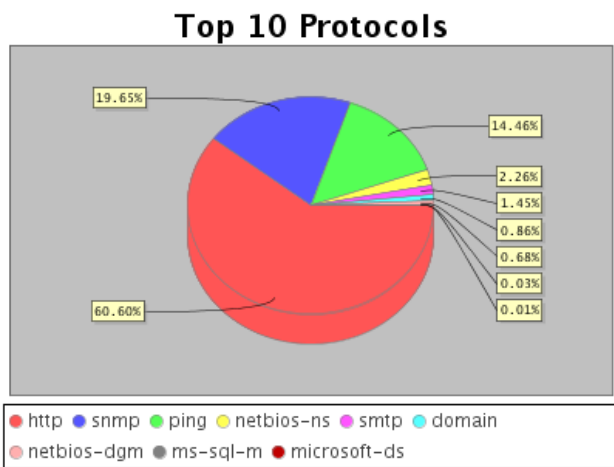

Benefits Summary

- Automated collection of incoming flow data from v5 probes.
- At a glance charts of data breakdown by type, talker and listener.
- A quick next step in identifying bottlenecks and the cause.
- Make use of NetFlow features already available in your routers.
- Filter on Probe and Interface

Background

This module is a direct result of customer feedback. A number of our customers were seeing high utilisation from our interface graphs and wanted to know the breakdown of the traffic to see whether it was authorised application use or otherwise. Without the need for deep packet analysis and the associated costs, our NetFlow module provides a simple breakdown of traffic types.

Time Frame: Using data from before 10/4/09 6:13 PM

Go beyond Utilisation and see who or what is generating the traffic on your network links

Mutiny version 4.1+ supports Cisco NetFlow™ v5 from suitable collectors on your network.

Mutiny analyses the flows and stores them for reporting within the Mutiny system interface.

Maintaining Mutiny's ease of use USP, users can quickly analyse top talkers or protocols from the NetFlow screen
